New nucleic acid encoding human parotid secretory protein or its fragments - useful for diagnosis and treatment of, e.g. digestive and endocrine disorders and for drug screening

Claim 16; Fig 1: 94pp: English.

This sequence is the human parotid secretory protein (hPSP) of the invention. The hPSP DNA is useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting, amplification or immuno assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune system disorders. A particular application is diagnosis of cancers of the salivary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibacterial, antiparasitic and antiviral agents and may be expressed in vivo from the DNA. The protein, or cells expressing it, are used in screening tests to identify specific acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing the DNA are used to atsess the recombinant protein and this can be used to raise Ab, useful for diagnosis, therapy, for affinity purification and to identify

```
purification of HPSP from natural sources. Expression of HPSP may indicate cell proliferation. HPSP nucleic acid or its fragments are used to detect HPSP-encoding sequences (optionally after amplification by PCR) by hybridisation, particularly for diagnosis and monitoring of disease, but also for mapping the chromosomal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         screen for its antagonists. Antibodies are useful directly as antagonists, to transport drugs to HPSP-expressing cells, to detect cells that express HPSP, to monitor patients being treated with HPSP, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                This represents a human parotid secretory protein (HPSP). Antagonists that bind specifically to, and modulate activity of HPSP are used to treat cancer and autolimune diseases particularly of secretory or gastrointestinal tissue, e.g. cancer of salivary gland, thyroid, prostate, breast, gastrointestinal tract or pancreas, Sjorgen's syndrome, Graves disease, thyroiditis, insulin-dependent diabetes, pancreatitis, ulcerative colitis, Crohn's disease and atrophic gastritis. Host cells containing expression vectors comprising the HPSP nucleic acid are used to produce recombinant HPSP which is used to generate antibodies and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 LGVLQKSSAWQLAKQKAQEAEKLLNNVISKLLPTNTUIFGLKISNSLILDVKAEPIDDGK 120

                                                                                                                                                                                                                                                                                                                                    29-JUN-2000.
                                                                                                                                                                                                                                     The present invention describes an isolated antibody that binds to one of the human PRO proteins designated PRO212, PRO30, PRO311, PRO535, PRO619, PRO1031, PRO105, PRO105, PRO1050, PRO2198, PRO319, PRO1151, PRO1152, PRO1184, PRO2198, PRO antagonists can be used to inhibit tumour cell growth. The PRO polypeptides and nucleotides are useful in the treated without compounds and prevention of cancer. The antibodies and other anti-tumour compounds maybe used to treat various conditions, including those characterised by overexpression and/or activation of the amplified anti-tumour compounds maybe used to treat various conditions, including those characterised by overexpression and/or activation of the amplified artibodies and other compounds include benign or malignant tumours controlled and cher proceed. Prosectal, prostate pancreatic, lung, vulva, thyroid hepstic carcinomas, sarcomas, globlastomas, and various head and neck tumours), leukaemias and lymphoid malignancies, other disorders such as neuronal, epithelial, stronal and blastocoedic disorders, and inflammatory, angiogenic and immunologic disorders. AAC5836 represent PCR primers and hybridisation probes used in the isolation of the human PRO sequences. AAC58367 to AAC5836 and AAB24089 represent human PRO PRO polynucleotide and protein sequences given in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Thirty PRO polynucleotides encoding PRO polypeptides, useful in the treatment, diagnosis and prevention of cancer \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 1228; DB 21; Length 249; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human secreted protein amino acid sequence. The invention relates to sequences AAART25.A8774 which encode human secreted proteins AAB25563-B25812. The proteins include signal peptides. Included in the invention are a host cell containing one of the cDNA sequences, and a purified antibody capable of binding to one of the secreted proteins. Also contained in the invention are methods for storing the sequence data on a computer system, and a method for identifying features of the CDNA sequences using a computer programme. The CDNAs are useful for expressing secreted proteins or fragments to obtain antibodies capable of specifically binding to the secreted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mitochondriocytopathy; diabetes; atherosclerosis; Alzheimer's disease; neurodegenerative disorder; graft rejection; dementia; hyperlipidaemia;
                                                                                                                                                Polynucleotides and polypeptides encoding proteins with signal peptides, useful in diagnostic, forensic, gene therapy and chromosome mapping procedures -

proteins. The cDNAs may also be useful in diagnostic, forensic, gene therapy and chromosome mapping procedures and may be used to design expression vectors and secretion vectors. The proteins of the invention may be used to treat diseases including cancer, autoimmue diseases, cardiovascular disorders, cystic fibrosis, hypothyroidism, immunological disorders, amyloidosis, brain disorders, skeletal muscle disorders, eye disorders, obesity, mitochondriocytopathies, diabetes, atherosclerosis, neurodegenerative disorders, graft rejection, Alzheimer's disease, dementia, hyperlipidaemia, septic shock and impotence.

AAM25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antinifiammatory; antirheumatic; cells they are expressed in, such as: antinifiammatory; antirheumatic; cells they are expressed in, such as: antinifiammatic; cardiant; central nervous system; virucide; antibacterial; endocrine; cardiant; cardianeamic; antiagraphy andiactic; unmunosuppressive; antiagraphy antiagraphmatic; untilders antiagraph, antiagraphmatic; antidabetic; cytostatic; neuroprotective; antidepressant; nootropic; antidabetic; cytostatic; neuroprotectides are useful for screening for production. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, reunopathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, barmacopical disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic incurological disorders, cancer, multiple sclerosis, depression, heurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               121 GLNLSFPVTANVTVAGPIIGQIINLKASUDILTAVTIETDPQTHQPVAVIGECASDPTSI 180

Human brain expressed single exon probe encoded protein SEQ ID NO: 34413.
                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and dissplaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide #9264 encoded by probe for measuring placental gene expression.
                                                              The present invention provides a number of single exon nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                          The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of

The patent discloses novel polynucleotides and their corresponding proteins which play a major role in induction of growth, cell migration and proliferation. Cell-cell interaction and the differentiation of tissue specific cells. These proteins are important in the maintenance of tissue integrity and thus are important in wound healing. They are useful in various assays to determine the biological activity, to raise antibodies, to isolate corresponding interacting proteins or other compounds, and as therapeutic target in a whole range of disease states. Compositions comprising the novel proteins of the invention are useful in genome and physical mapping, in positional cloning of are useful in genome and physical mapping, in positional cloning of creatment of mammalian diseases. Polynucleotides of the invention are useful in genome and physical mapping, in positional cloning of treatment of mammalian diseases which is the consequence of inappropriate expression of kinase genes. They are useful for promoting immune response treatment, as immunoregularcry and anti-inflammatory molecule, as diagnostic for specific types of cancer readment, as target for antagonists in the treatment of an anti-cancer treatment, and as a target for antagonists in the treatment of diseases such as asthma and allergy. They are also useful to inhibit or enhance the activity of the soluble molecule that binds proteins of the invention, for tissue and neural regeneration, to promote or block the invention, and as anti-inflammatory and/or vaccine adjuvant.

The present sequence is 28.6 kba protein, a secreted protein from mouse.

The sequence is predicted from a full-length CDNA clone (see AAX59356) isolated from a human adult brain (thalamus) CDNA lbbrary. The invention provides CDNA clones (see AAX59352-58)

encoding novel secreted proteins (see AAY06404-10) of the human testis, brain and foetal kidney. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data are provided. Suggested activities include nutritional, cytokine, cell proliferation or differentiation, immunostimulatent (e.g. as vaccine) or immunosuppressive, haematopoiesis regulating, tissue

                       contain at least on epitope in their sequences. The present invention relates to detection of a target LS170 polynucleotide that comprises the treating a test sample with at least one LS170 specific nucleic acid that has at least 50 percent identity with any of the sequences (AAX00801-09) which are fragments derived from various clones of LS170 gene. The LS170 overlapping sequences trepresent a set of contiguous, partially overlapping sequences transcribed from lung tissue. They are used for diagnosis, staging, monitoring, in vivo imaging, prevention and treatment of lung disease, specifically cancer, and to indicate predisposition to such disease, particularly detection of LS170 polynucleotide. LS170 antigons, or anti-LS170 antibodies is indicative of disease. Cells transformed with an expression system comprising the LS170 nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences are used to express recombinant polypeptides. The polypeptides are used to raise Ab and for drug screening. LS170-related nucleic acid can be used to isolate related sequences; as standards and reagents in assays; as targets for drug screening, and scomponents or targets for therappy, e.g. as antisense, ribozyme or triplex-forming agents. Ab can be used to deliver therapeutic agents to LS170-expressing cells; directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                74 KQKAQEAEKI,LNNVISK---LLPTNTDIFGLKISNSLILDVKAEPIDDGKGLNLSFPVTA 130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           78 kpgggtsggliggligkvesvipglnniidikvtdpglielglvgspdghrlyvtiplgi 137

Lung specific genes for developing products for diagnosing, monitoring, staging, prognosticating, imaging and treating lung cancer

Example 2; Page 35-36; 37pp; English.

The present sequence is encoded by a lung specific gene, designated Lng110, clone ID 135520, gene ID 236760. The specification describes methods for diagnosing the presence of lung cancer in a patient. The method comprises measuring levels of lung specific genes in cells, tissues or bodily fluids, and comparing the level to that of a normal human control. The methods can be used for diagnosing, monitoring, staging or prognosticating lung cancer, especially metastatic lung cancer. Antibodies against proteins encoded by lung specific genes can be used for imaging or, when conjugated to a cytotoxic agent, for treating lung cancer.

```
The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation activity or may induce production of other or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiencies and disorders e.g. severe combined communed ficiencies and disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GVHD), in the induction of tumour immunity, myloid or lymphoid cell deficiencies, wound healing and tissue repair, in the treatment of burns, incisions and ulcers; as well as in treatment of periodontal disease, osteoporosis or osteoarthritis, mediated by inflammatory processes, diseases of the peripheral nervous system, and shy-brager syndrome, infections, and shy-brager syndrome, infections, and infartion of cardiac and central nervous system vessel e.g. stroke, and infartion of icardiac and central nervous system vessel e.g. stroke, and infartion of icardiac and central nervous system vessel e.g. stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sepsis, inflammatory bowel disease, ulcers, bone regeneration. The protein, having activin or inhibin-related activities is useful as a contraceptive based on the ability of inhibins to decrease fertility in female mammals and decrease spermatogenesis in male mammals. The proteins and nucleic acids are also useful as food supplements. The present sequence represents a secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   74 KQKAQEAEKLLNNVISK---LLPTNTDIFGLKISNSLILDVKAEPIDDGKGLNLSFPVTA 130
